

OUTSOURCEIT

A Complete Backup and Recovery Solution

Your business data changes every minute of everyday. Emails, proposals, contracts, documents, and applications are constantly being revised and created. What would happen if you lost all of your data and communications—from even one day?

SafetyNet delivers backup protection and disaster recovery in both physical and virtual environments with greater flexibility and value for your changing business needs. You can be secure that all of your data in all locations is secure and retrievable.

Tape Free = Worry Free

Traditional tape backups are slow, time-consuming, and have a 40 to 50% failure rate. In addition, once-a-day tape backups leave you vulnerable to data loss or data corruption, and recovering data quickly in the event of a virus or other disaster can be cumbersome.

SafetyNet is an off-site, 100% disk-based backup with real-time data replication—which means your data is backed up the moment it is created. All system information, applications, settings, and data are regularly backed up and securely stored at OUTSOURCEIT's data centers. These data centers are mirrored and can back up multiple computers, servers, and operating systems—giving you the scalability you need.

SafetyNet eliminates errors with RAID 5 storage self-healing functionality that cross-checks links, headers, and files. Our enterprise level deduplication and delta-blocking tools reduce the amount of data needs to be backed up—improving efficiency and recovery time. With **SafetyNet**, you have a 100% guarantee that your valuable data is secure and recoverable.

The Agentless Advantage

SafetyNet's unique agentless data protection exceeds agent-based technology by working remotely through the operating system's and application's APIs. This agentless architecture assures that you experience no operating system and application disruption or downtime for implementation or upgrades; no security risk because of an open agent port that can be hacked; and no server cycles being wasted for agent software. At the same time, you enjoy flexible RPO—including CDP—with incomparably fast and flexible recovery.

Benefits

- Military-grade encryption—secures data the moment it is read from disk
- Data deduplication and compression
- Reduction of CPU and network utilization through byte-pattern differentials
- One-time full backup
- Guaranteed restore capabilities
- Automatic integrity checks—ensure backup data is correct and accessible
- Archive self-healing—corrects data integrity issues automatically
- Unlimited versioning and history—restores any file from any point in time
- Unlimited files and file sizes—allows complete backup

OUTSOURCEIT provides backup and recovery of all your servers, including file, data, application, and Exchange with powerful cloud software.

Key Features

Significant savings

Even if agents from traditional backup and recovery vendors were free, our SafetyNet solution would still enable huge reductions in operating expenses.

Simple licensing

Purchase software the same as disk capacity—no license fees, no tracking, no overspending on site licenses. You only pay for compressed and deduplicated capacity consumed.

One piece of software to install, manage, and upgrade

Intelligent software self-upgrades—eliminating time-consuming pushing of agents or updates out to hundreds or thousands of remote-site systems.

WAN/LAN/CPU resource conservation

Software runs with negligible impact on servers, workstations, and laptops—eliminating the CPU-cycle hits associated with agent-based solutions.

Robust, hardcoded security

No agents to open hacker-tempting ports in the firewall.

Elegant scaling

Agentless backup/recovery solution easily accommodates new capacity, new applications, and new sites.
